TASK 1 — WEB APPLICATION QA REPORT

Automation & QA Developer Take-Home Skills Assessment

Candidate	Aditya Javalekar
Application selected	RealWorld / Conduit public demo
Primary URL	https://demo.realworld.io/
Assessment date	10 November 2026
Report status	**Evidence-limited draft — not a completed five-bug investigation**

Integrity note: This report records only evidence that could be independently checked in this session. No account was created and no sign-in, article creation, edit, delete, or logout UI flow was completed. Unexecuted checks are clearly marked; they are not presented as confirmed bugs.

1. Executive Summary

The selected assessment target was the public RealWorld / Conduit demo at https://demo.realworld.io/. A direct request to that URL returned **HTTP 404 Not Found** on 10 November 2026. This prevents the requested UI-based investigation from being completed against that specific demo URL. The RealWorld documentation identifies a newer demo frontend at https://demo.realworld.show and a public API at https://api.realworld.show/api; it also describes restrictions on visibility of user-created content. These documentation details are useful for selecting a replacement target, but do not establish defects in the UI.

Outcome: one confirmed environment/accessibility finding is documented below. Four additional high-value test scenarios are included as pending validation, not counted as discovered defects. A full submission requires reproducing and documenting at least five actual issues on a reachable application, as required by the assessment.

2. Scope and Test Approach

Required user flows: sign-up, login, create content, edit content, delete content, and log out. **Additional checks:** input validation, duplicate account handling, session persistence, error feedback, accessibility, and network failure behavior.

Execution method: public page/source availability check and review of official RealWorld documentation. Interactive browser testing was not available in this execution environment; therefore, no UI actions or state-changing requests were claimed as completed.

3. Confirmed Finding

#	Title / Summary	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause
1	**Legacy public demo URL returns HTTP 404** Status: Confirmed during URL availability check.	1. Open https://demo.realworld.io/ in a browser or send a GET request. 2. Observe the HTTP response.	**Expected:** the public demo homepage loads and exposes the Conduit app. **Actual:** the request returned HTTP 404 Not Found on 10 Nov 2026.	**High** Blocks testing through the selected URL.	Unknown from external observation. Possible causes include a retired route, hosting configuration change, or removed deployment. Server logs/deployment configuration are required to determine the actual cause.

4. Pending Test Scenarios — Not Confirmed Defects

ID	Scenario to execute	Steps / edge cases	Expected behavior	Status
P-01	Registration validation	Submit blank fields; invalid email; short password; duplicate email/username.	Inline, clear validation; no duplicate account; no raw server error.	Not run
P-02	Login error handling	Submit unknown email and incorrect password; inspect error message and response.	Generic, useful error feedback; no crash or sensitive account disclosure.	Not run
P-03	Article creation validation	Attempt empty title/body; use long text and special characters.	Required fields are validated; content is safely accepted or rejected with clear feedback.	Not run
P-04	Edit and persistence	Create an article, edit title/body, save, refresh, reopen article.	Saved changes persist and are reflected consistently across views.	Not run
P-05	Delete and authorization	Delete an owned article; try opening its URL afterward; verify another user cannot delete it.	Deleted content is unavailable; unauthorized delete is rejected.	Not run

5. Root Cause Analysis — Confirmed Access Failure

The observed symptom is that the selected legacy demo URL returned HTTP 404 Not Found during the availability check. A 404 response indicates that the requested resource was not found at that address; it does not, by itself, identify why the resource is missing. The most likely investigation areas are whether the old demo route has been retired, whether DNS/hosting or reverse-proxy routing changed, and whether the deployment was moved to a replacement frontend. The RealWorld documentation now points to a different hosted frontend and a separate public API, which suggests the assessment target may have changed over time, but this does not prove the underlying cause of the 404. I would first confirm the canonical current demo URL with the project maintainers, then inspect deployment health, route configuration, and server logs. If the old URL is intentionally retired, I would update the test environment and document the replacement URL rather than classify the retired route as an application functional defect. I would also add a lightweight availability check so future test runs detect a broken demo link before functional testing begins.

6. Evidence and References

• Availability check: https://demo.realworld.io/ — HTTP 404 Not Found observed on 10 November 2026.

• RealWorld API documentation: https://docs.realworld.show/specifications/frontend/api/ — identifies the hosted API endpoint and documents public demo visibility limitations.

• Alternative RealWorld frontend surfaced in public search: https://realworld.svelte.dev/register — sign-up route is indexed as a Conduit page. It has not been interactively tested in this report.

7. Completion Checklist

Requirement	Status
Selected application / target documented	Done
At least five actual issues reproduced and recorded	Not complete — only one confirmed access finding
Sign-up, login, create, edit, delete, logout UI flows	Not run
5–10 sentence root cause analysis	Done for confirmed access failure; root cause remains unverified
Screenshots / recordings	Not captured

Final note: Do not submit this evidence-limited draft as if it contains five verified bugs. To meet the assignment fully, the remaining scenarios must be executed on a reachable RealWorld implementation, and each reported issue must include reproducible actual results.
